AGENTIC CODE REVIEW

Review that shows its evidence

We help reviewers catch AI-written software that looks right but isn't, by showing the evidence for every finding.

Technical overview · logo is a prototype

Cheap to write.
Flawless to look at.
Five times as long to check.

Where AI use is high:

≈5×

as long to review a change

+31%

more changes go out with no review

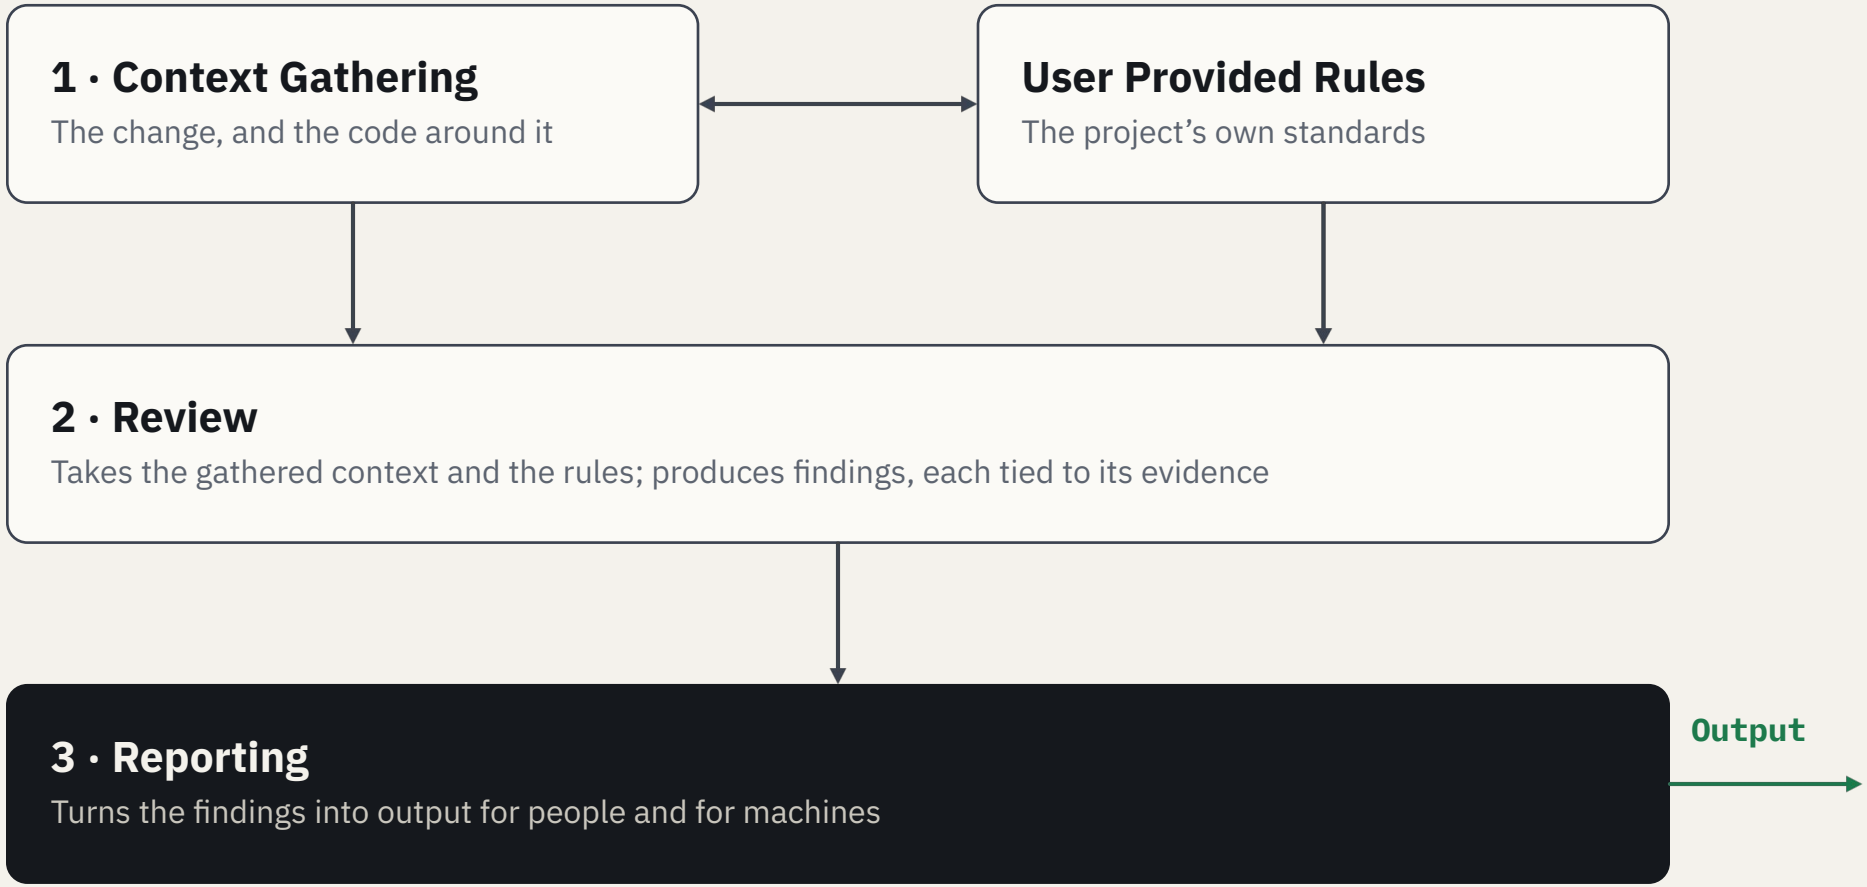

Faros AI, 22,000 developers, via O'Reilly: review time +441.5%, unreviewed merges +31.3%. Vendor data; a link, not a cause.

Where we differ: nothing hidden, every gap reported

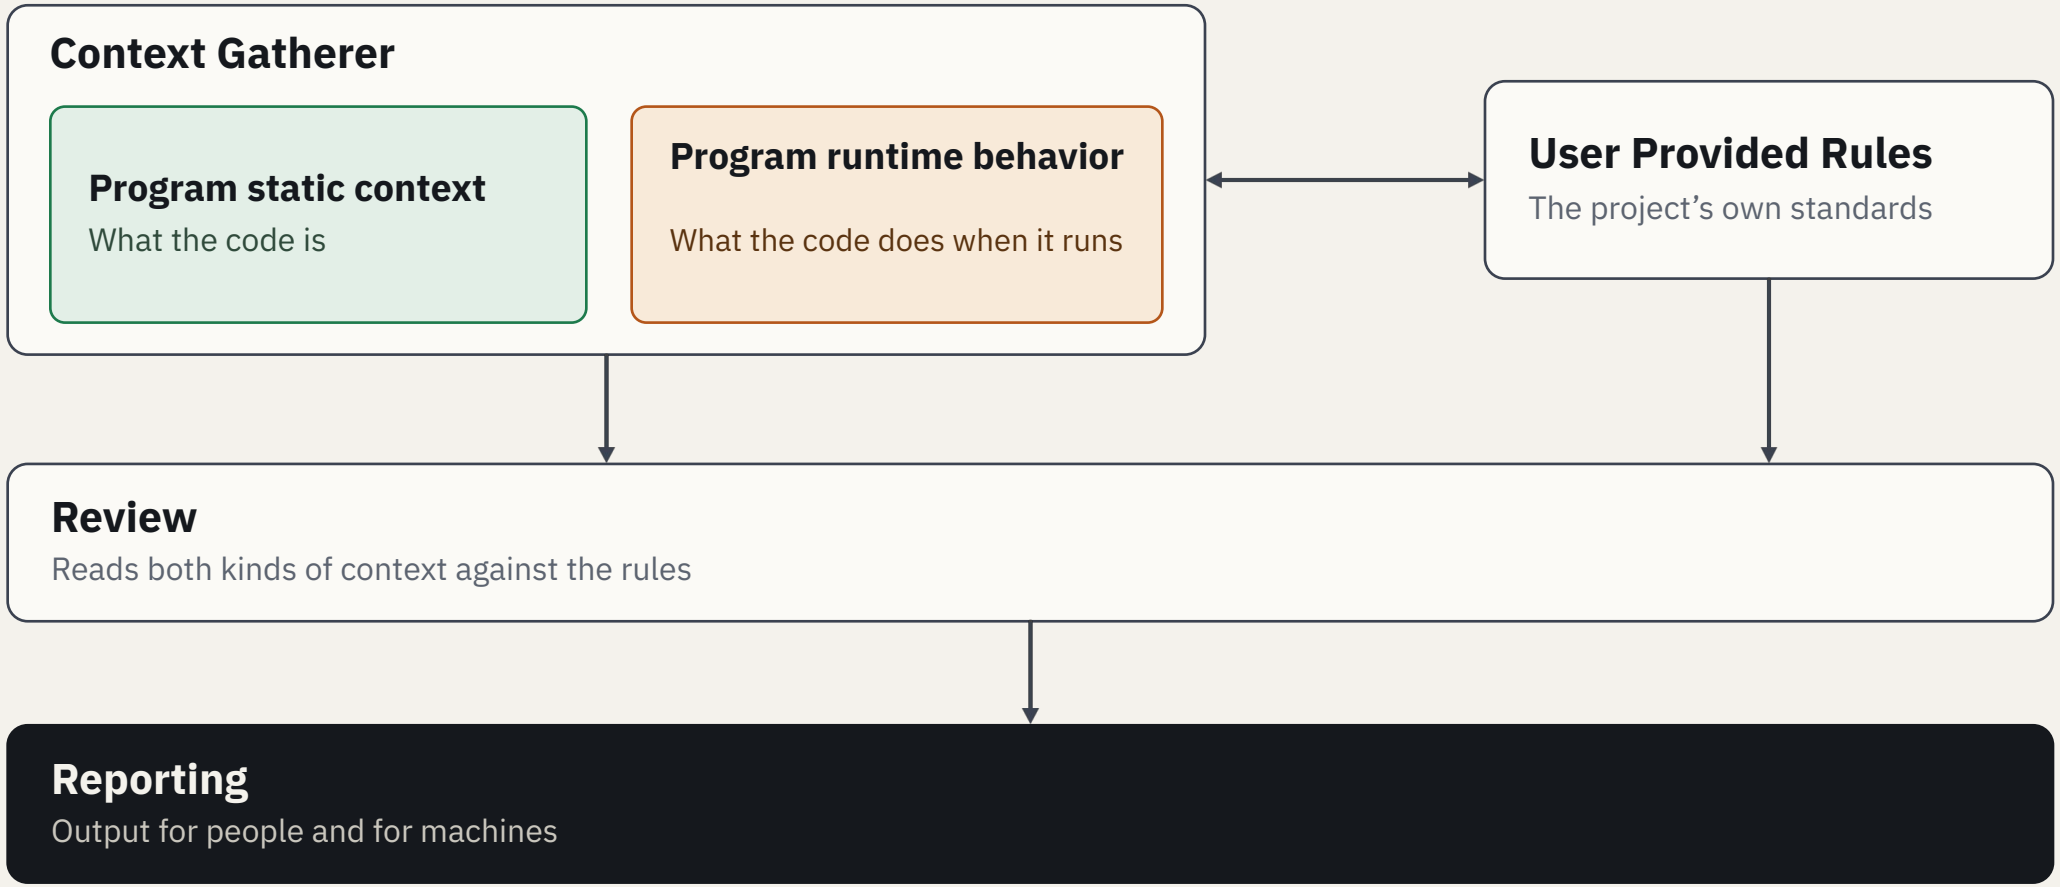

Tool	How a finding is checked	An unconfirmed finding
CodeRabbit	Scripts and linters in a sandbox	Filtered out
Greptile	Tests written and run in a sandbox	Not stated
Qodo	A judge agent	Filtered out
Claude Code Review	A verification step	Filtered out
Agentic Code Review	One model pass; the project's own tests next (specified)	Kept, labelled "unverified"

Sources: each vendor's own pages, read 2026-10-10. Rivals verify more than our build does today.

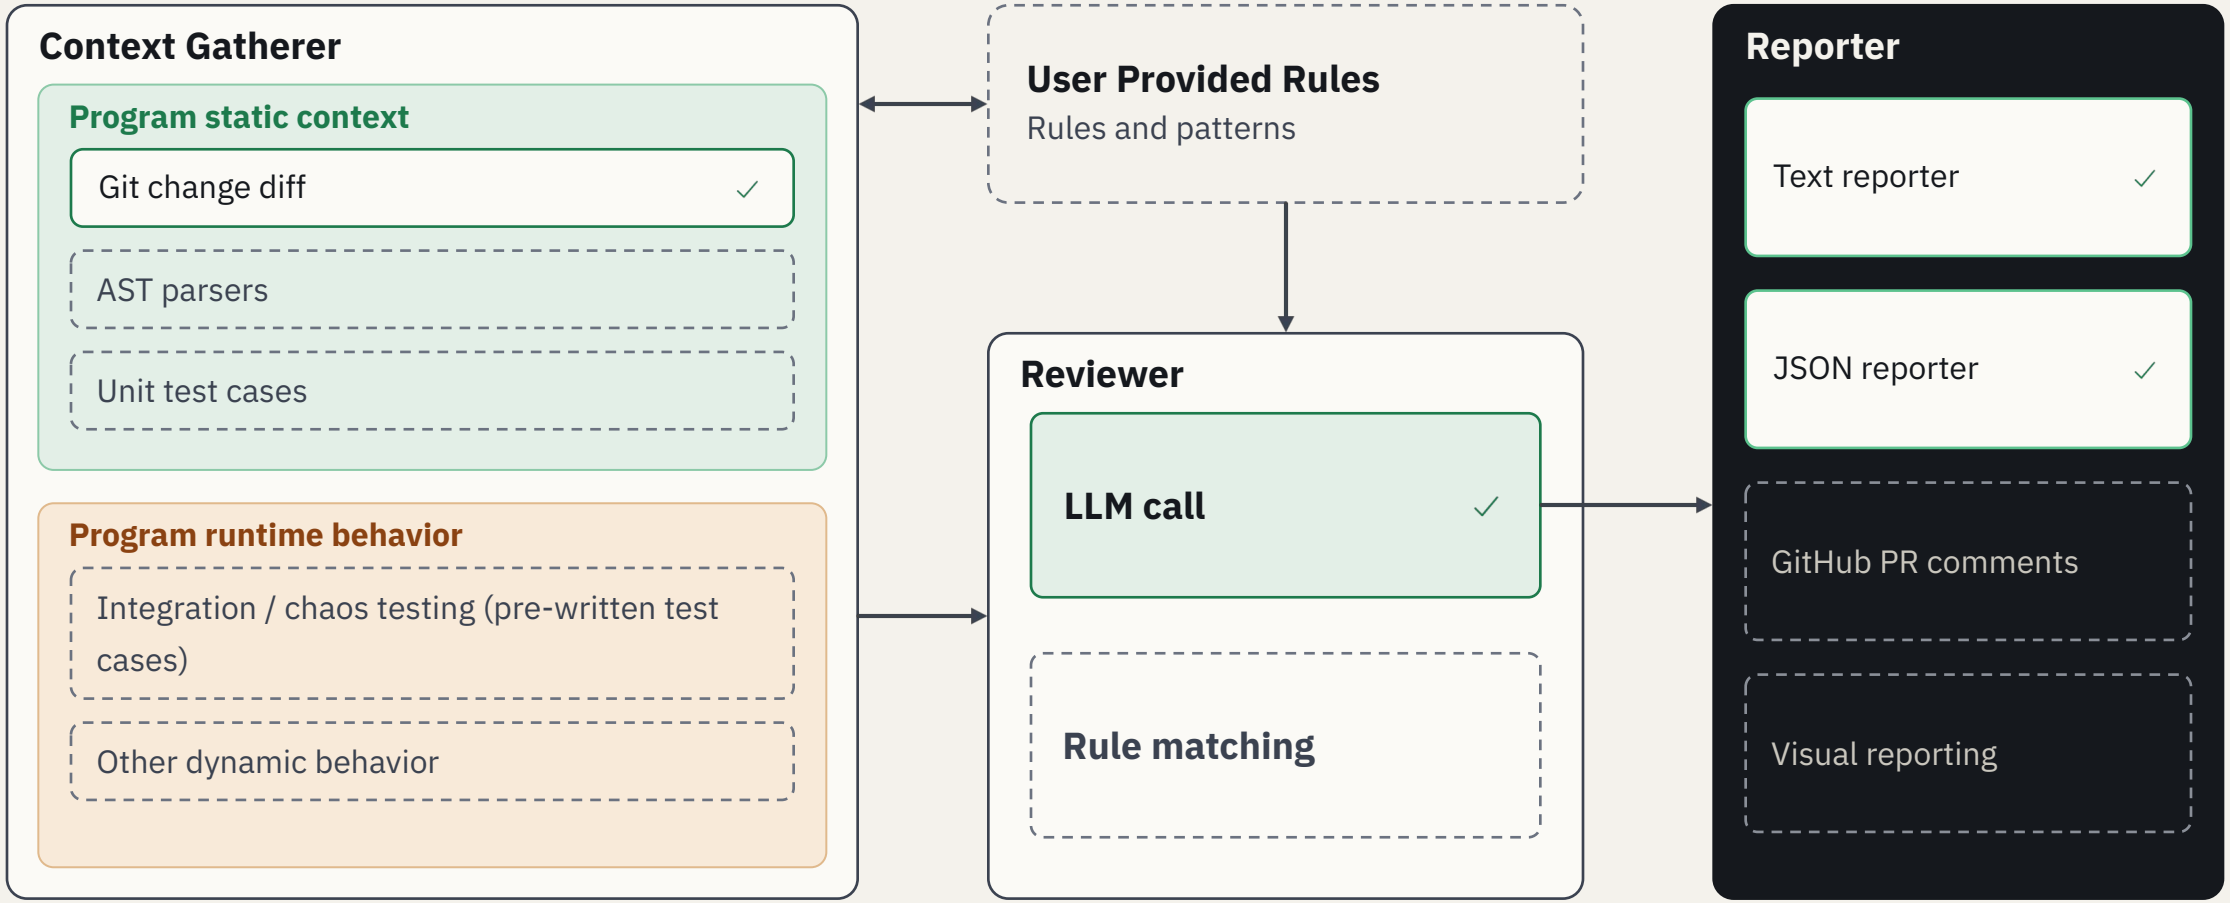

Level 1: gather, review, report

Level 2: two kinds of context

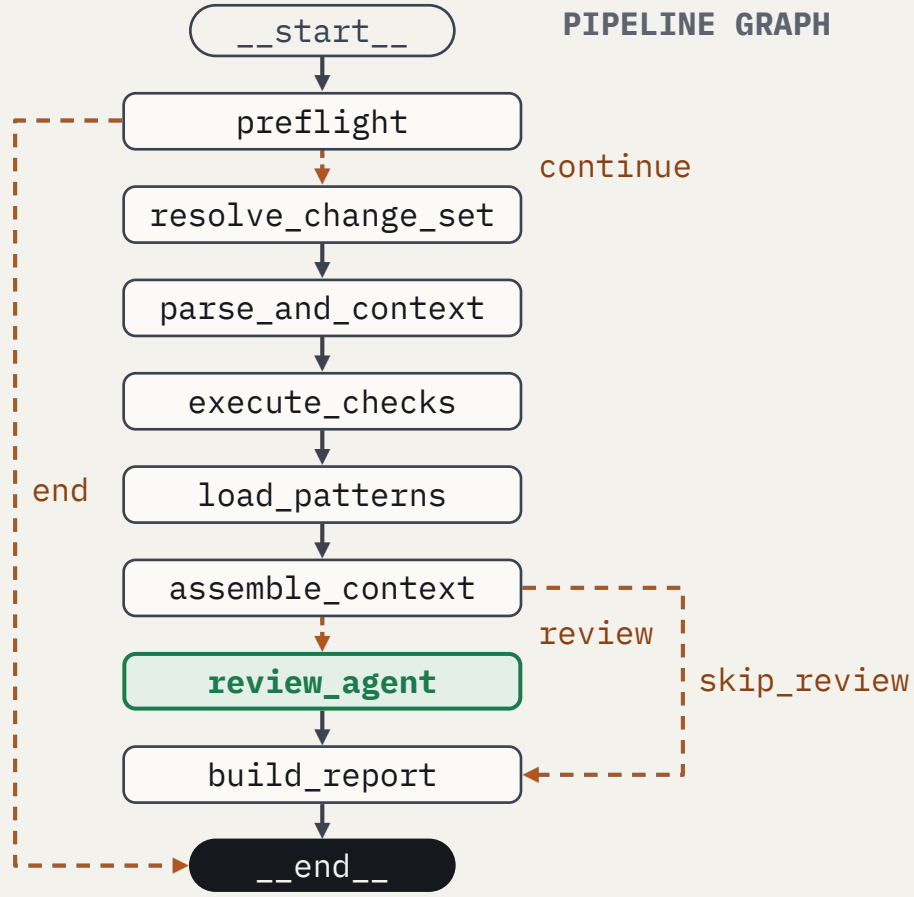

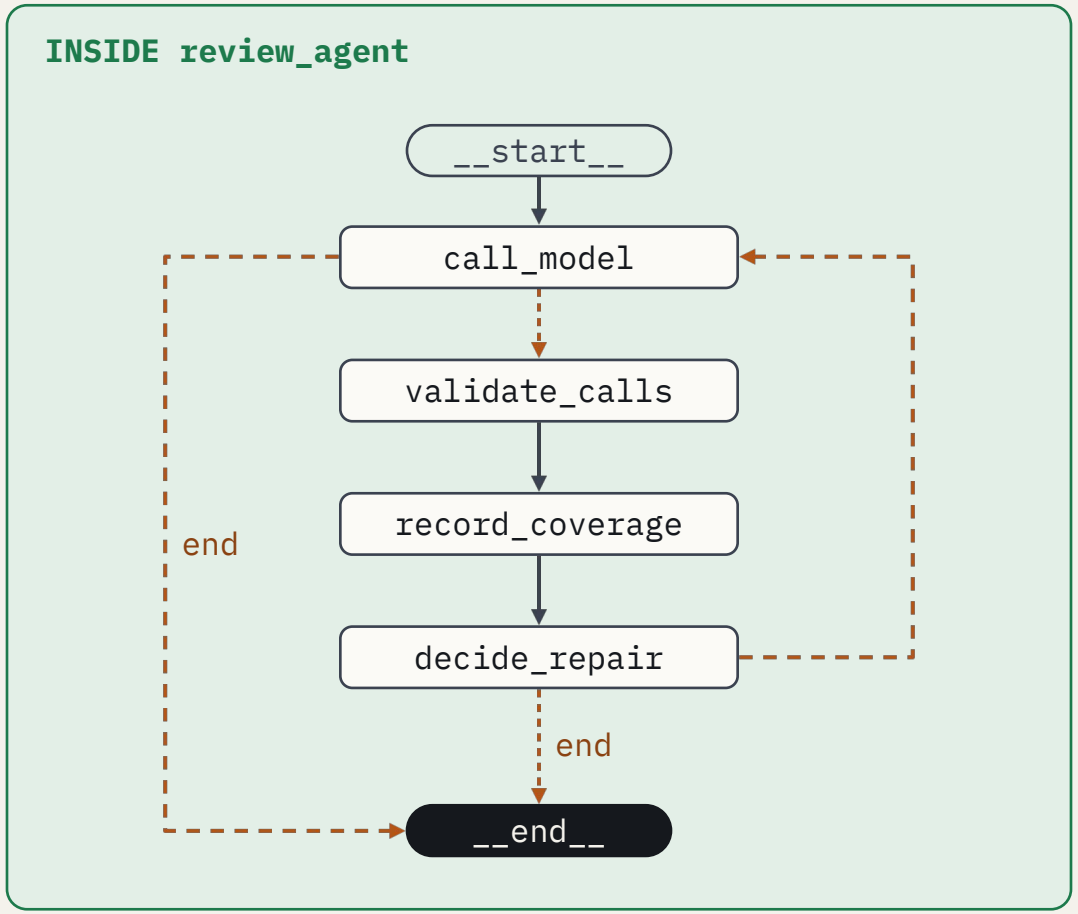

Level 3: each part, built or not

Solid, with a check: built, as of the 9 Oct 2026 run. **Dashed:** designed, not built yet. · Component design · level 3 of 3

LangGraph: the graph that runs

Solid: fixed edge. **Dashed, orange:** conditional edge, labelled with its route. The green node opens up on the right.

Stack: what runs

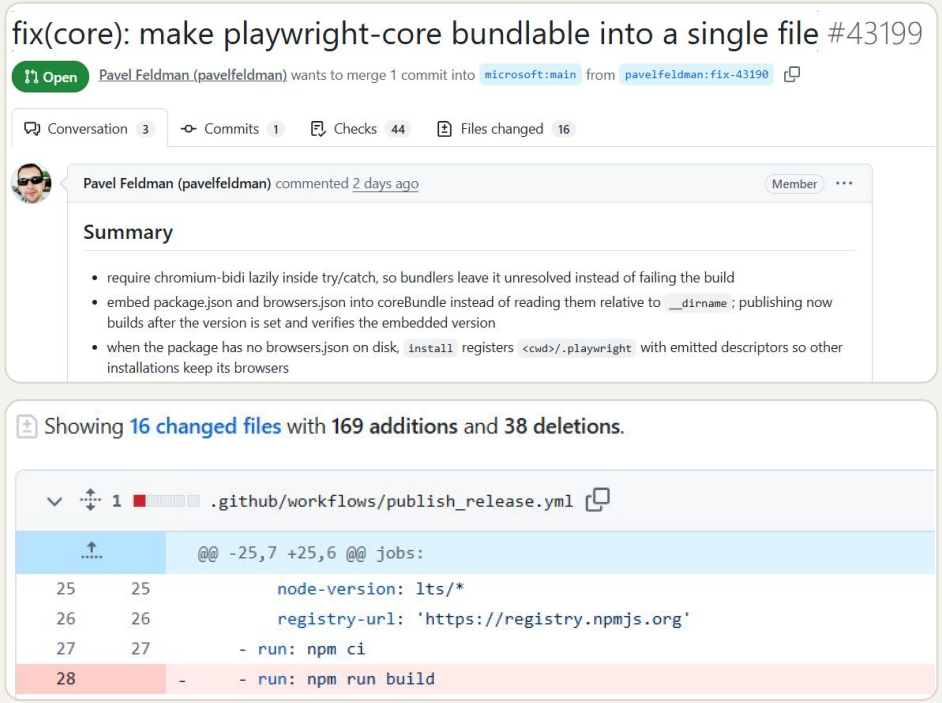

PACKAGE	VERSION	ROLE
pydantic	2.13.5	Finding model, report schema, config validation
pyyaml	6.0.3	Config parsing
typer	0.27.2	CLI, with click 8.5.0
rich	15.0.0	Terminal rendering
langchain-core	1.6.3	Tool binding, messages
langchain-openai	1.6.2	OpenAI-compatible provider client
langgraph	1.2.11	Review-step graph (CF-6 only)
openai	3.14.1	Transitive; its APIError hierarchy is mapped to provider-error
langfuse	5.0.1	Tracing and observability of model calls

Python. Versions as pinned in the project’s dependency list; Langfuse is the newest addition.

Every finding shows its evidence

```
$ agentic-review review --pr https://github.com/microsoft/playwright/pull/43199
```

INPUT · THE PULL REQUEST ON GITHUB

OUTPUT · WHAT THE TOOL REPORTED

16 files	**10** reviewed	**6** listed, not reviewed

nit correctness lines 49–53 **evidence: diff hunk 1**

`packages/playwright-core/src/server/registry/index.ts` … **calculateSha1(installationLinkTarget())** … will evaluate differently if **process.cwd()** differs between install and uninstall when bundled, leaving orphaned **.links** files.

⚠ **Its own caveats.** No checks were run and no related context was gathered in this build. No finding call named 9 of the 10 reviewed files.

Verdict: findings, none blocking 125.4 s, including the clone

Run 2026-10-09; the finding is unconfirmed by maintainers. Next: the project's own tests and rules as evidence (specified, not built).
